

## **A. Software Installation**

The communication between the X-Plane software and the Sea Gull instruments is controlled by a program, called a Plugin, created by Sea Gull, according to the X-plane conventions.

After this installation the Sea Gull plug in is present on your PC.

Please take the following step to install the software.

Install the software on your PC as you find it on the Sea Gull CD (or on the download section of our website). *We assume you have basic MS-Windows knowledge to use the Explorer, to copy/paste a file.*

### **1. Copy,**

- from: the X-Plane directory on the CD,
- the file: SG\_XPLM\_interface.xpl
- to: the subdirectory ..\Resources\plugins\  
of the X-Plane installation on your PC  
e.g. \Program files\X-Plane\X-system 800\Resources\plugins.

Please note that (beside PluginAdmin.xpl, PluginAdminWin.xpl and possible other plugins) you have only one version of the SG\_XPLM\_interface.xpl in this directory. X-plane will run every .xpl file present in this directory!

- 2. IMPORTANT: Now follow the (separate) "Installation Instructions for the SeaGull Interface Box" for the installation of the FTDI2XX USB driver before you connect the Interface Box to the PC!**
- 3. Follow the separate instructions for the connection of the instruments.**
